

Bosch Rexroth VT-SSPA1-1-1X/V0/0-24 proportional valve amplifier

Manufacturer: Bosch Rexroth

Manufacturer part number / published order designation: R900779643

Published model: VT-SSPA1-1-1X/V0/0-24

About this compilation

Prepared by Hydmaster from selected manufacturer documentation. Original technical pages follow without cropped drawings, rewritten data or altered units. This cover and index are Hydmaster editorial material, not a manufacturer-issued exact-execution datasheet.

Coverage: selected pages relevant to the identified size and configuration. Other options or neighbouring models retained on an original page apply only where explicitly identified.

Execution notes and conditions

Rated output 1.6 A is the catalog adjustment reference; match actual coil and inductance. 340 Hz at catalog rated current.

Ambient -25 to 70 °C applies to this connector execution; IP65 requires mounted cable/connector. Ramp minimum depends on the solenoid.

Source-page index

Source page numbers below are physical pages of each complete original PDF. The original printed page labels and technical content remain unchanged. Compiled page numbers count this cover/index.

Source A: Bosch Rexroth VT-SSPA1 - RE30116, edition 2015-12

Original pages	Compiled pages	Relevant content
1-8	2-9	Manufacturer plug-in amplifier overview and original photographs; Exact literal material-number/type rows, rated current and application-specific frequency; Connector accessories and two/three-conductor command applications; Four-conductor command operation and current/ramp function; Type-specific supply, coil, ramp and connector-dependent temperature limits; Actual PG11 or M12 electrical connection and terminal requirements; Connector-dependent dimensions and adjustment elements; Solenoid wiring, filtering and installation constraints

Valve amplifier for proportional valves

Type VT-SSPA1-1 (5, 50, 100, 150)

RE 30116

Edition: 2015-12

Replaces: 2015-03

H7072+7645

- ▶ Component series 1X
- ▶ Analog, connector design
- ▶ Suitable for controlling solenoid-actuated pressure and directional valves without position control (see page 2)

Features

- ▶ Proportional command value/current characteristic curve for command values between 0 and 100 %
- ▶ Regulated adjustable maximum current for command values greater than approx. 120 % (for differential input only)
- ▶ Differential input
- ▶ Separate up/down ramp generator
- ▶ Zero potentiometer / pilot current
- ▶ Command value attenuator / maximum current
- ▶ Dither frequency potentiometer
- ▶ 24 V operating voltage

Applications

2-conductor technology (only with differential input)

- Switching application with fixed flow control
- Ramp function upon switch-on

The “IN+” input is bridged with supply voltage ($+U_B$) in the connector, the IN- input is bridged with supply voltage (0 V) in the connector.

The maximum current must generally be adjusted according to the solenoid information using potentiometer “G”. The ramp time “ramp up” ($t <$) can be set within the range of $t_{\min}$ to 5 s.

3-conductor technology (only with differential input)

- Switching application with fixed flow control
- Switching with low control power
- Ramp function can be adjusted separately when switching on and off the control voltage

The “IN+” input is connected to the control voltage ($U_s = 24\text{ V}$), the “IN-” input is bridged with supply voltage (0 V) in the connector.

The maximum current must generally be adjusted according to the solenoid information using potentiometer “G”. When switched off (“IN+” = 0 V or “IN+” = open) a pilot current can be set at “Z”. This serves to reduce the switch-on delay, particularly with ramp. If required, this value can be adjusted between approx. 0 mA and approx. 15% of the rated current. The ramp times “ramp up” ($t <$) and “ramp down” – ($t >$) can be set within the range of $t_{\min}$ to 5 s.

Applications (continued)

4-conductor technology

The “IN+” input is connected to the control signal ($U_s = 0 \dots 10 \text{ V} / 24 \text{ V}$), the “IN-” input is connected to the reference potential of the control voltage. Pilot current and maximum current are set using potentiometers “Z” and “G” prior to commissioning. The current can now be proportionally adjusted according to the control voltage between the set pilot current and the set maximum current. The pilot current can be set in the range of approx. 0 mA to approx. 15% of the rated current, the maximum current can be set in the range of 0 to $I_{\max}$ (see technical data page 5).

Function

The plug-in amplifier is suitable for installation on a valve connection base according to EN 175301-803. By turning the plug insert and the electronics in the housing, the plug-in amplifier can be mounted on the solenoid in 90° increments.

Command value presetting

The command value range is between 0 and U_B . In the command value range 0... 10 V the solenoid current is proportional to the command value. Starting with a command value of 12 V up to U_B the solenoid current is almost constant according to the $I_{\max}$ setting (switching application).

Ramp generator

The ramp generator (5) limits the rise of the control output. The up and down ramp times can be adjusted separately. In switching applications, the ramps can be used to dampen the switch-on and switch-off impulse. (When switching off only with 3-conductor connection, i.e. switching signal and supply are connected separately.)

This behavior also depends on the valve and solenoid type. The downstream command value attenuator (4) has no influence on the ramp time.

Characteristic curve

Up to a command value of approx. 110% the transfer characteristic curve rises linearly. The zero point can be corrected using potentiometer “Z”, the maximum value can be corrected using potentiometer “G”.

Power output stage

Output stage (7) is freely clocking. The clock frequency depends on the current level, the operating voltage and the impedance of the controlled solenoid. The clock frequency can be re-adjusted using potentiometer “f”. The current output stage generates a regulated current signal according to the control output provided by the summing device (3). If the clock frequency is too high, the valve hysteresis is increased. If the clock frequency is too low, the noise level of the hydraulic system is increased.

() = Assignment to the block diagram

Block diagram

- (1) Internal voltage adjustment
- (2) Command value input
- (3) Zero point potentiometer “Z” / pilot current / (IN = 0%)
- (4) Command value attenuator “G” / maximum current / (IN = 100%)
- (5) Ramp time potentiometers “t <” and “t >”
- (6) Frequency range correction “f”
- (7) Power output stage

Characteristic curve

Notice:

Depending on the type, the pilot current can also be "0".

Weight	m	0.125 kg				

¹⁾ Usually corresponds to a cable length < 100 m

²⁾ With a solenoid resistance of $R = 19.5 \Omega$ and a solenoid current of $I = 100$ mA

³⁾ The minimum ramp time depends on the valve solenoid. The values indicated here should be considered as a guideline only and may vary

Electrical connection

Terminal / pin		Terminal / pin	
+UB / 1	Operating voltage U_B 24 V	IN+ / 2	Command value input 24 V; 0...10 V
0 V / 3	0 V ground	IN- / 4	Reference potential for the command value

Terminal connection

Risk of malfunctions in case of EMC/ESD interference on the connection cable

Do not route command value connection lines through this section!

The connection for the protective earthing conductor is accessible after the electronic printed-circuit board has been removed.

Connection cross-section:
4 x 0.75 mm² shielded or
5 x 0.5 mm² shielded (connect shield in control cabinet)
For VT-SSPA1-50:
4 x 1.5 mm² shielded (connect shield in control cabinet)
Cable diameter: 4.5 ... 11 mm

M12 plug-in connector port

Connector on amplifier

Mating connector and wire colors with pre-assembled cable set

Please order the cable set separately, see page 3

The connection for the protective earthing conductor is not provided

Connection cross-section:
4 x 0.75 mm² shielded
(connect shield in control cabinet)

Adjustment elements / dimensions (dimensions in mm)

Top view on open housing:

- G Command value attenuator / maximum current
- Z Zero point potentiometer / pilot current
- $t <$ Ramp time "up"
- $t >$ Ramp time "down"
- f Frequency range

Project planning / maintenance instructions / additional information

- ▶ The plug insert can be rotated in 90° steps in compliance with ESD protective measures.
- ▶ The plug-in amplifier may only be wired when de-energized.
- ▶ Do not lay lines close to power cables!
- ▶ The distance to aerial lines, radios, and radar systems has to be 1 m at least.
- ▶ To set the potentiometers and to check the current values, use the measuring adapter and measure the currents in a potential-free manner.
- ▶ The specified maximum solenoid currents must not be exceeded.
- ▶ Do not use solenoids with integrated free-wheeling diodes.
- ▶ The supply voltage is to be protected by means of a fuse – see “Technical data”.

Notice:

The solenoids are controlled with a clocked voltage. The solenoid voltage impulse level corresponds to the applied operating voltage ($+U_B$).

Solenoids with integrated EMC protection circuit may only be used if the response voltage of the protection circuit - both, for positive and negative voltage - is greater than the actual operating voltage.

The specifications of the valve manufacturers are to be observed.

Notice:

- ▶ With a strongly fluctuating operating voltage, it may in the individual case be necessary to use an external smoothing capacitor with a capacity of approx. 470 µF to 2200 µF.
- ▶ The line length should not exceed 50 m. For longer lines, a capacitor with $C \geq 100 \mu\text{F}$ has to be connected between U_B and 0 V. The line between capacitor and plug-in amplifier must not be longer than 50 m.

Recommendation: Capacitor module VT 11110 (see data sheet 30750); sufficient for up to 5 plug-in amplifiers

Further information
